Adobe Photoshop Elements is also available on a desktop computer. It's a simplified version of the traditional Photoshop and is used by people who don't have a high budget. It has simpler tools and features. Less obvious, but equally important, is the fact that this new version of Adobe Photoshop is now written in React Native. Maybe I am not the first to raise the question, but did Adobe already get into mobile? If you are not familiar with React Native, it is a web development framework that combines the strengths of JavaScript with native code. React Native has now been adopted by over 400 companies and is growing in popularity in various sectors, so it is starting to make inroads into software in other areas. Why use React Native? It is a modern tool that allows you to build a single codebase for both the web and the iOS and Android platforms at once, making it easier to iterate on one codebase. It allows for consistent styling, and as I mentioned, makes these apps accessible to novice users. React Native makes development a pleasure, and it should make you feel like a "pro." After just a few months with React Native, these new apps feel extremely polished and perform well. However, there is still a lot of room for improvement. For now, the developers are still in the process of polishing the app, and we are likely to see a lot of functionality being added over the next few months. Still, by using the same editing algorithm as Photoshop, the apps should just work, and they do.
